Theoretically, there are 3 chemical mechanisms of cellulose alterations: (1) acid hydrolysis, involving breakage of the 1-4 acetalic bonds and multiplication of the terminal acetalic aldehyde functional groups, (2) oxidation, without macromolecular chain breakage, of alcohol functions in the aldehyde, ketone, or acid state and oxidation of 1-4 acetal functional groups in the ester function state, and (3) hydrolysis reactions caused by alkalis present in 1-4 acetalic bonds adjacent to ketone functions in position 3 as well as with

DESCRIPTORS: *Cotton textiles, *Textiles, Textile industry, Mechanical properties, Chemical properties, Fibers, Deformation.

From a qualitative point of view, the theory outlined makes it possible to characterize the mechanical behavior of a fabric from the mean load-stretch curve of its fibers, and from the mean deformation imposed on them by the construction of the fabric. It thereby permits us to define purely mechanical wear as the loss of mechanical resistance with no appreciable variation in the load-stretch curve, and purely chemical wear as the loss of mechanical resistance resulting from the

Tests show that the disappearance of the striae of lower tension than that of the surrounding medium as well as the existence of defects in the boundary surfaces are due to the surface tension. A cullet of a higher surface tension than that of the composition glass should not be used when melting glass. The considerable influence is shown of the reducing atmosphere of the furnaces on the surface tension of the vitreous mass and on the displacement of the layers, by which it is possible in the manufacture of amber yellow glass, to obtain a regular coloration.
